

MAmidiMEmo

The Virtual S/W Synthesizer

User's Manual – for MAmidiMEmo V5.5.1.0

What is the MAmidiMEmo?

- MAmidiMEmo is a virtual chiptune sound MIDI module for Windows
- You can use MIDI or DAW to sound the MAmi
- MAmi supports various sound chips*
- Also, MAmi can drive real hardware chips* via SCCI, VSIF

*** Supported chips are the following**

- PCM: C140, SPC700
- FM Synthesis: OPM, OPN2, OPNA, OPLL, OPL, OPL3
- WSG: NAMCO CUS30, HuC6280, SCC
- PSG: SID, POKEY, GB APU, SN76496, NES APU, MSM5232, AY-3-8910
- VOICE: TMS5220, SP0256, SAM
- MIDI: MT-32, CM-32P(Simulation)

*** Supported hardware is the following**

- VSIF: Genesis, SMS, Famicom, MSX, C64, PC-6001
- SCCI: OPM, OPNA, OPZ

Install & Basic Settings

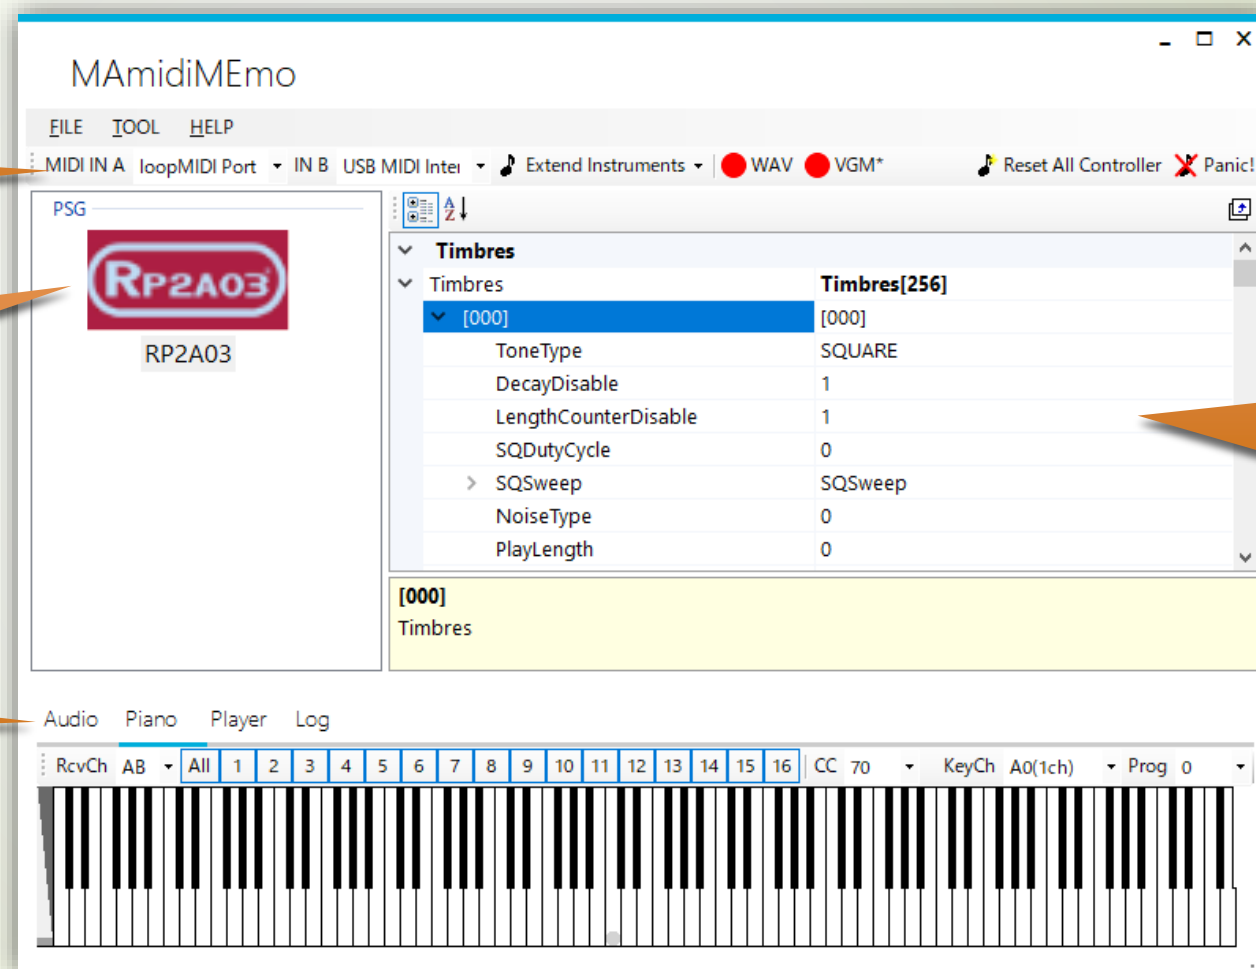

- Install & run
 - Extract the downloaded zip file.
 - Will open the MAmidiMEmo. If not, please check the followings.
 - **VC++ 2012 Runtime** installed on your PC.
<https://www.microsoft.com/en-au/download/details.aspx?id=30679>
 - (Execute "DelZoneID.ps1" to remove "Zone.Identifier" flag.)
 - Click MAmidiMEmo.exe to run

Window Overview

Tools

Chip
Parameter
Editor
(see next)

Add and Remove a Chip

To add
Select the chip
from this menu.

To remove
Open a context
menu and
select.

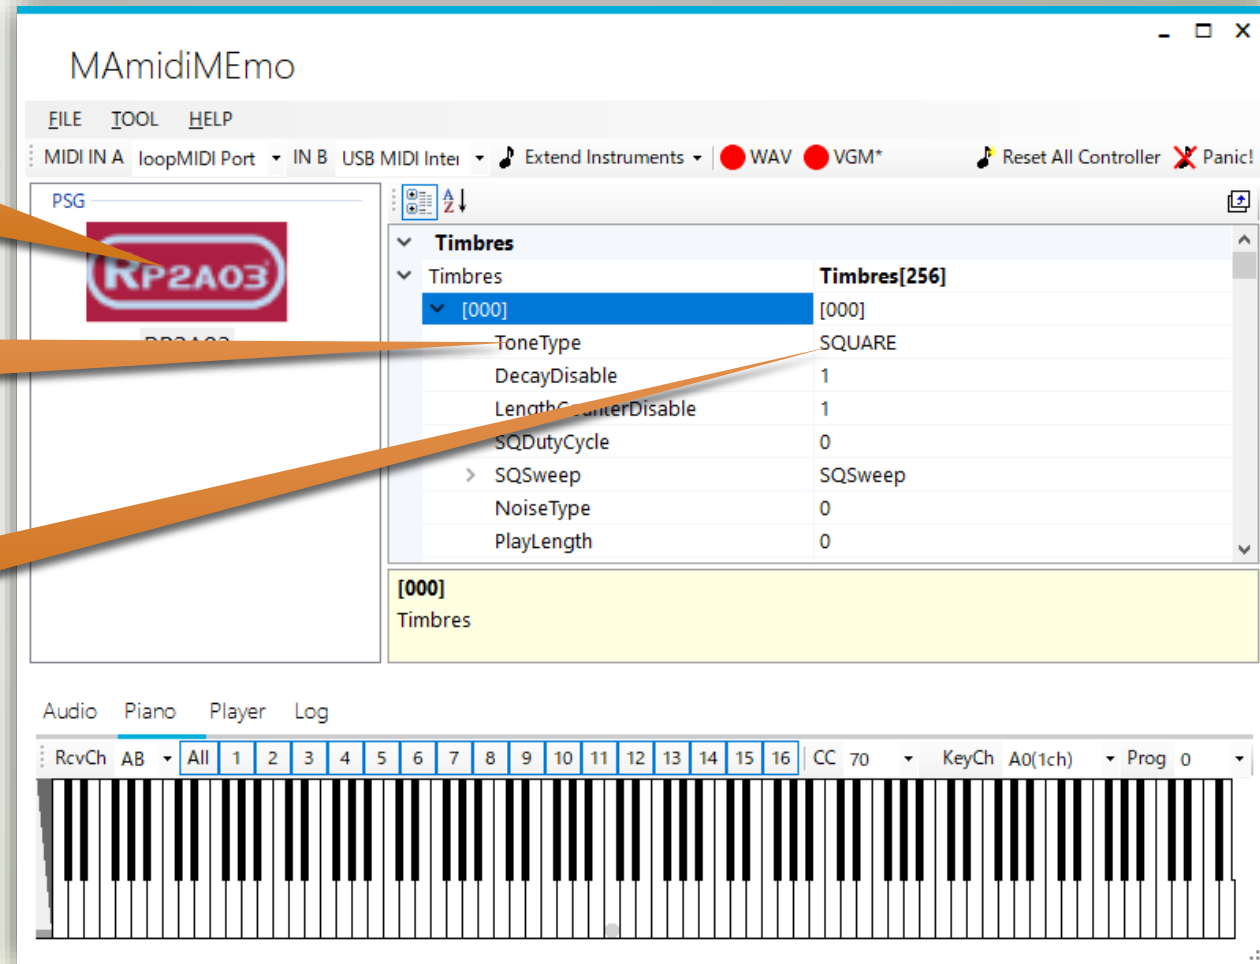

Edit chip and sound parameters

1. Click chip

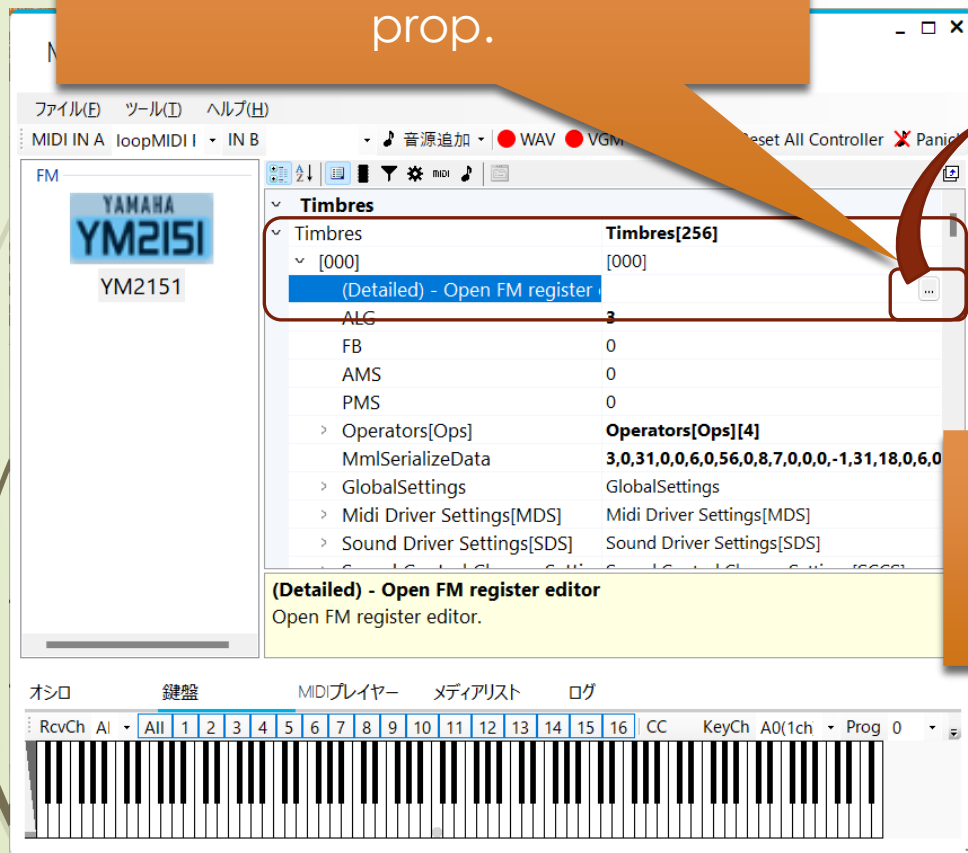

2. Click parameter

3. Change value

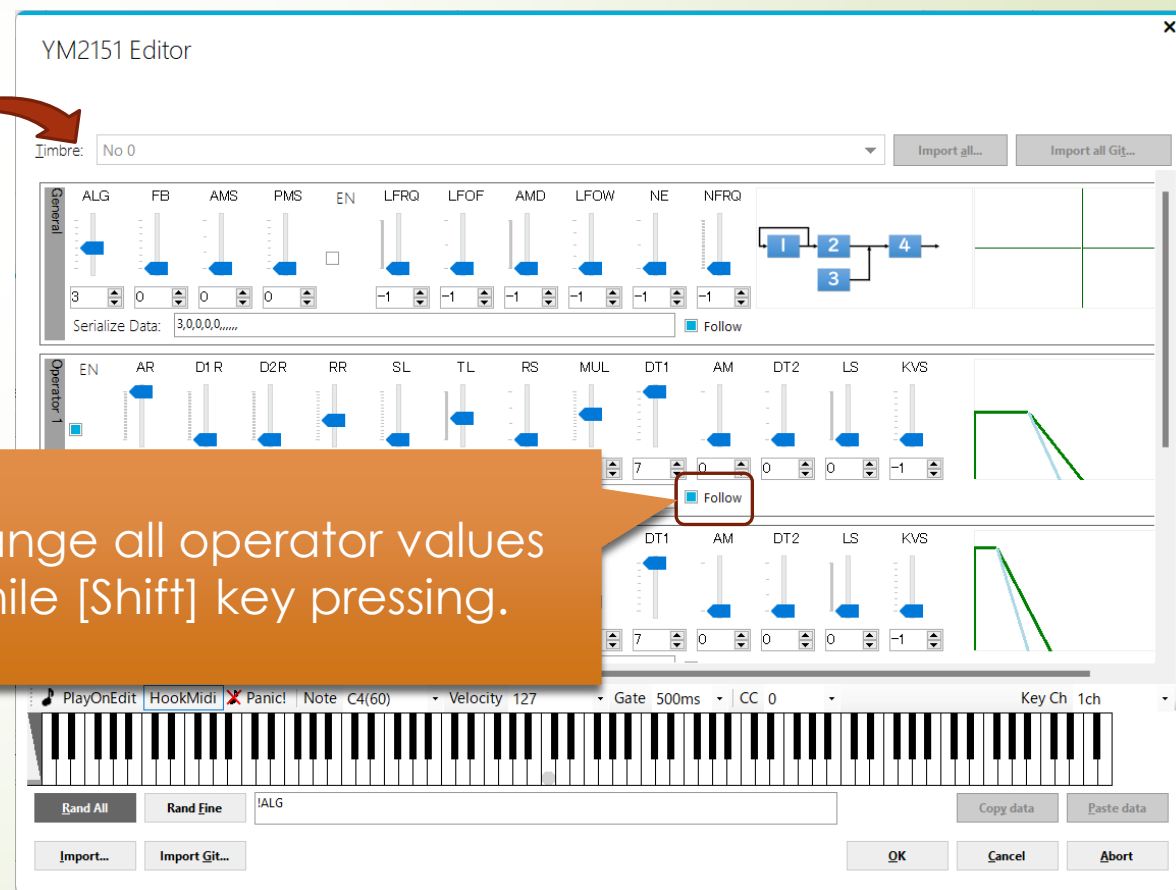

Edit FM registers with a GUI editor

Select a timbre and click the [...] button on the "(Detailed)" prop.

Change all operator values while [Shift] key pressing.

Between MIDI ch and Chip ch Relation.

- You don't need to concern the Chip ch. , generally. MAmidiMEMo will assign suitable Chip ch. automatically. However, you need to concern a max ch. number of the Chip.
- MAmidiMEMo will assign oldest sounding ch. to sound the new sounds.

MAmidiMEMo will assign empty ch. or oldest sounding ch. , generally.

Note On
Msg from
MIDI ch. X

MAmidiMEMo

Chip A

FM ch. 1

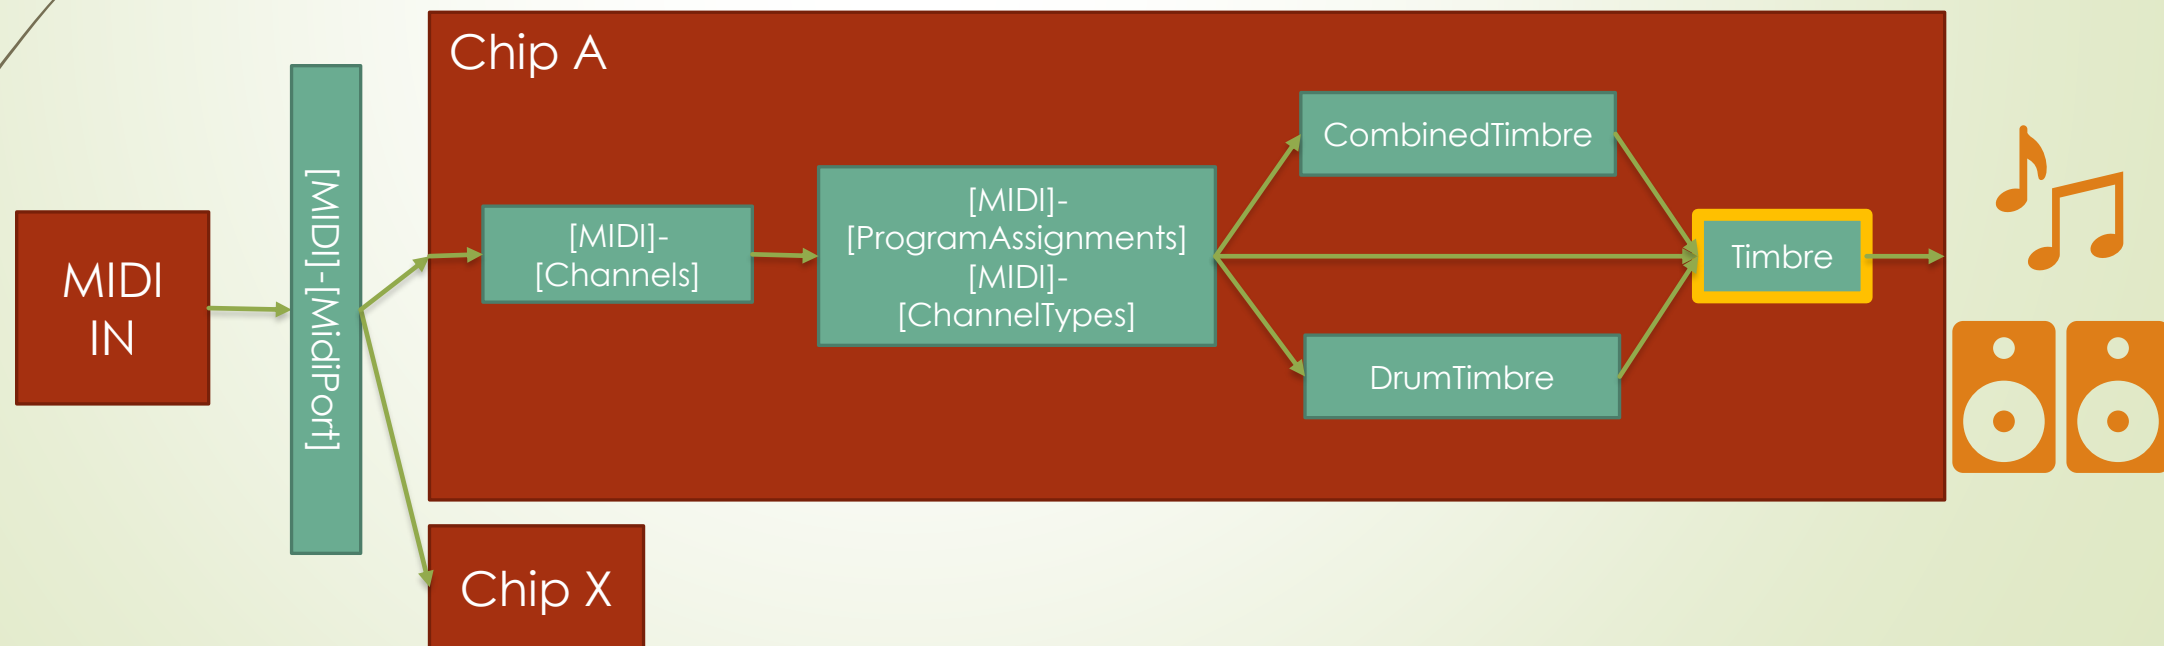

FM ch. 2

FM ch. 3

Sounding Structure

- MAmidiMEmo outputs a sound from MIDI message along with the following structure.
So, at least, you need to edit the **Timbre** parameters to sound something.

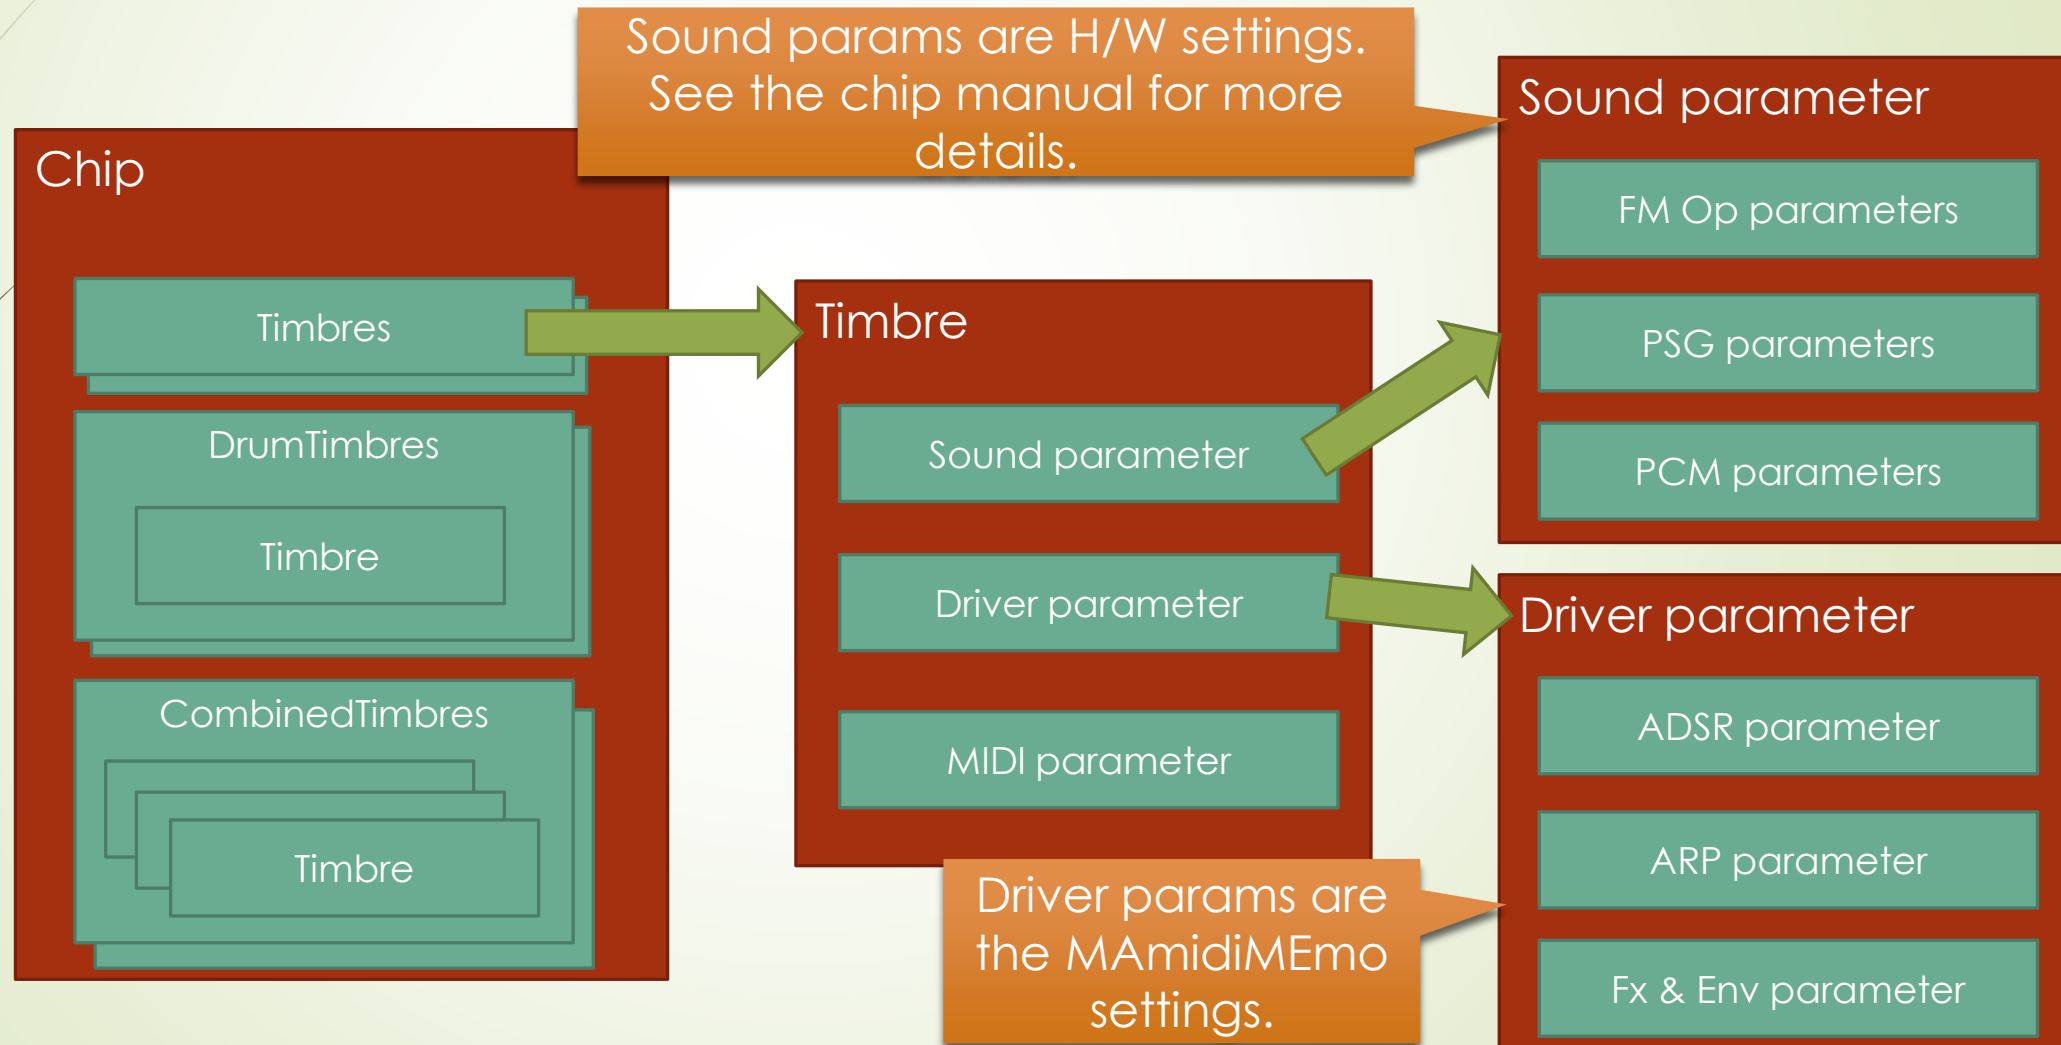

Timbre

- Generally, a chip has 256 Timbres, 256 CombinedTimbres, 128 DrumTimbres.
- CombinedTimbre can sound multiple Timbers at the same time (up to 4)
- DrumTimbre can sound Timbes as a Drum sounds (Ignoring Note Off msg).
- You can change the Timbre parameters on the Chip Parameter Editor. Generally, you need to learn the chip specification to edit the chip parameters.

Chip
Parameter
Editor

Timbre Structure

Driver parameters - Fx & Env Structure

- You can make for a rich sound by using driver params. Especially, FxS can do it.

Fx & Env parameter

Volume Env

Pitch Env

Arp Env

Dedicated Env

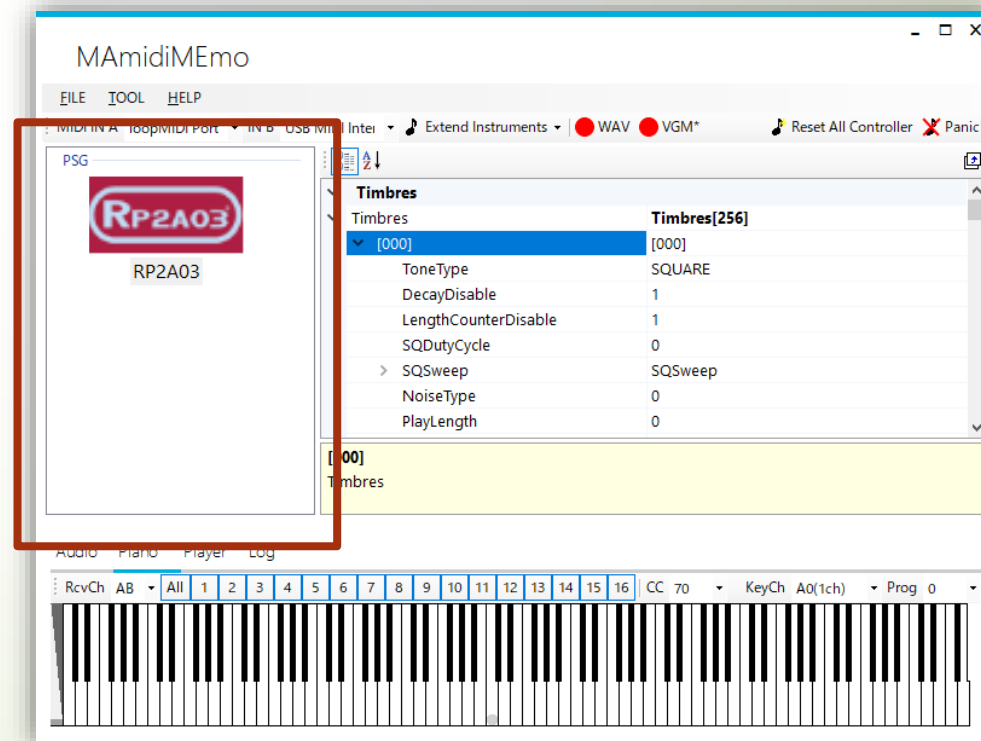

FxS	
Enable	False
DutyEnvelopes	
VolumeEnvelopes	
PitchEnvelopes	
PitchStepType	Relative
PitchEnvelopeRange	2
ArpEnvelopes	
ArpStepType	Absolute
EnvelopeInterval	50
Memo	
SerializeData	

Click here to open the GUI Editor.

Sample sounds

- There are sample sound files in the “Samples” folder. You can drop a sample file “*.MAmi” to the left pane.

Additional files

- YM2608

- Place legitimate "ym2608_adpcm_rom.bin" file in the MAmidiMEmo directory to sound ADPCM rhythm sounds.

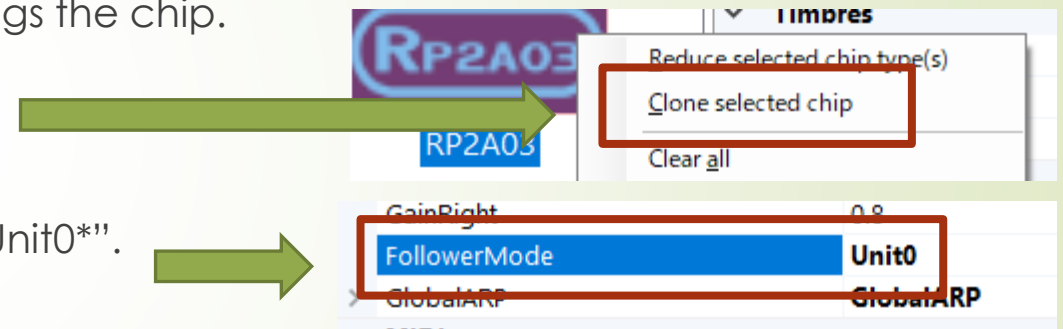

- MT-32

- Place legitimate "MT32_CONTROL.ROM" and "MT32_PCM.ROM" in the MAmidiMEmo directory to sound ADPCM sounds.

Limit Break

- Any chip can output only a few voices. However, MAmidiMEmo can break this limitation by the following steps.

1. Add a chip and complete all settings the chip.
2. Select the [Clone selected chip]
Cloned chip added.
3. Select the cloned chip and set the [Follower Mode] value to "Unit0*".
* If clone source chip ID is 0.

- When the clone source chip consumed all voices, the cloned chip sound for the chip.
- If you want to extend max voices more, select the [Clone selected chip] of the cloned chip. And set the [Follower Mode] value to "Unit0".

Use a real hardware

You can use a real hardware by using the VSIF / PCI device.

VGM Sound Interface(VSIF - UART) for Genesis/SMS

- MAmidiMEMo and VGMPlayer can drive real machine chips. Currently supports NTSC SMS(2, Mk *III*) for SN76489, OPLL and NTSC Genesis(MD) for SN76489, OPN2.
- How to
 1. Buy the following parts.
 - 1x UART dongle (Note: FT232R and so on. CH340 and CP2102 **may not work 163,840bps**, only 115,200bps.)
 - 1x FLASH Cart for SMS or Genesis and 1x D-SUB 9 pin female connector and DuPont wires
 2. Solder like the following and connect it to the JOYSTICK PORT 2.

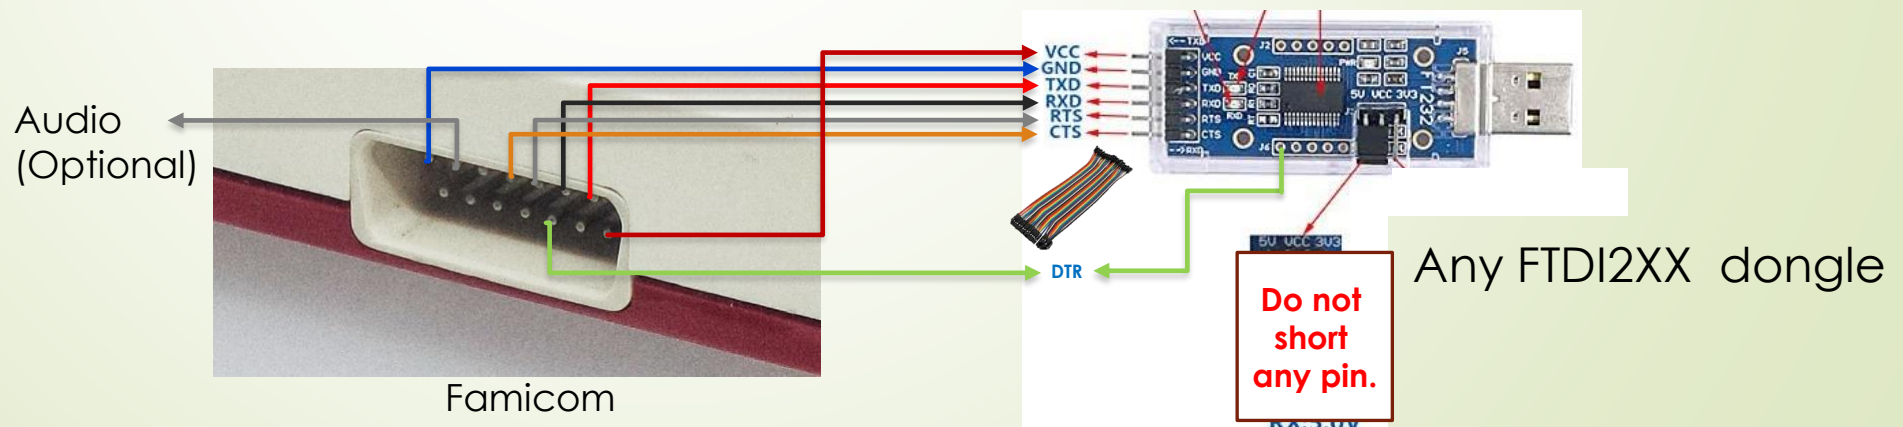

VGM Sound Interface(VSIF - FTDI) for Genesis

- MAmidiMEmo and VGMPlayer can drive real machine chips more faster if you use FTDI2xx(232R, **232H** and so on). Currently supports NTSC Genesis(MD) for SN76489, OPN2.
- How to
 1. Buy the following parts.
 - 1x FTDI2XX dongle (FT232R or FT2232H and so on. Need to support 5V. ***WARN* Please use a genuine dongle.**)
 - 1x FLASH Cart for Genesis and 1x D-SUB 9 pin female connector and DuPont wires
 2. Solder like the following and connect it to the JOYSTICK PORT 2.

VGM Sound Interface(VSIF - FTDI) for Famicom

- MAmidiMEMo can drive real machine chips more faster if you use FTDI2xx(232R, 232H and so on). Currently supports NTSC Famicom and RP2A03_(No DAC)/FDS/VRC6.
- How to
 1. Buy the following parts.
 - 1x FTDI2XX dongle (FT232R and so on. Need to support 5V. ***WARN* Please use a genuine dongle.**)
 - 1x FLASH Cart for Famicom and 1x D-SUB 15 pin female connector **for FC** and DuPont wires
 2. Solder like the following.

VGM Sound Interface(VSIF - FTDI) for MSX/PC-6001

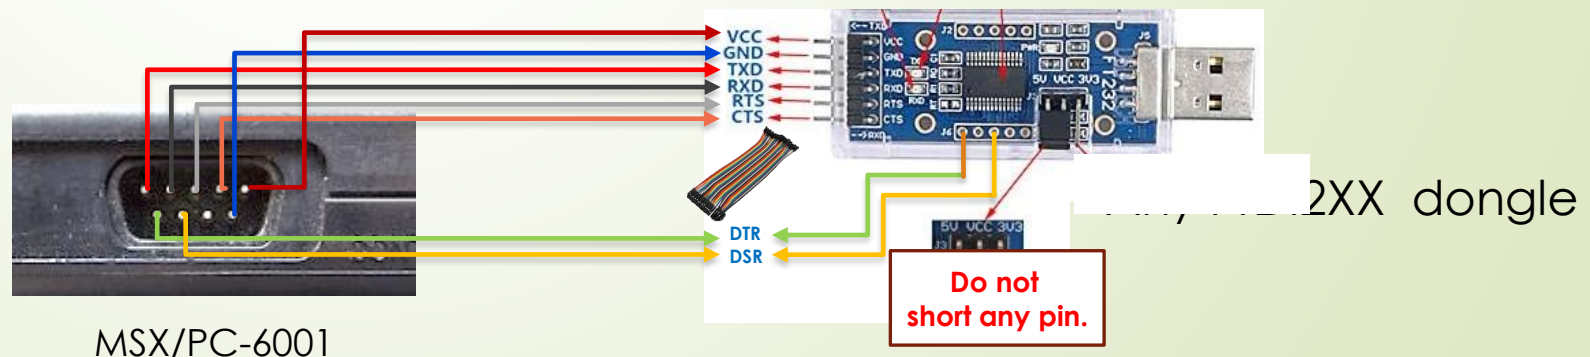

- MAmidiMEmo can drive real chips on MSX/P6 if you use FTDI2xx(232R, **232H** and so on). Currently supports NTSC MSX for AY-3-8910, OPLL, SCC+, OPM, OPNA, OPL3, Y8950.

NOTE1: Be sure to select proper SLOT# for SCC to use SCC.

Set FTDI clk value to 25 for each chip on normal MSX. If you have a tR, you can decrease value.

NOTE2: You can not use the VGM_P6M.ROM on 戦士のカートリッジ for PC-6001
- How to (You can also create a **dedicated dongle** from the [Gerber file](#).)

 1. Buy the following parts.
 - 1x FTDI2XX dongle (FT232R and so on. Need to support 5V. ***WARN* Please use a genuine dongle.**)
 - 1x D-SUB 9 pin female connector and DuPont wires
 2. Solder like the following and connect it to the JOYSTICK **P2**(MSX), **P1**(P6).

VGM Sound Interface(VSIF - FTDI) for Commodore 64(C64)

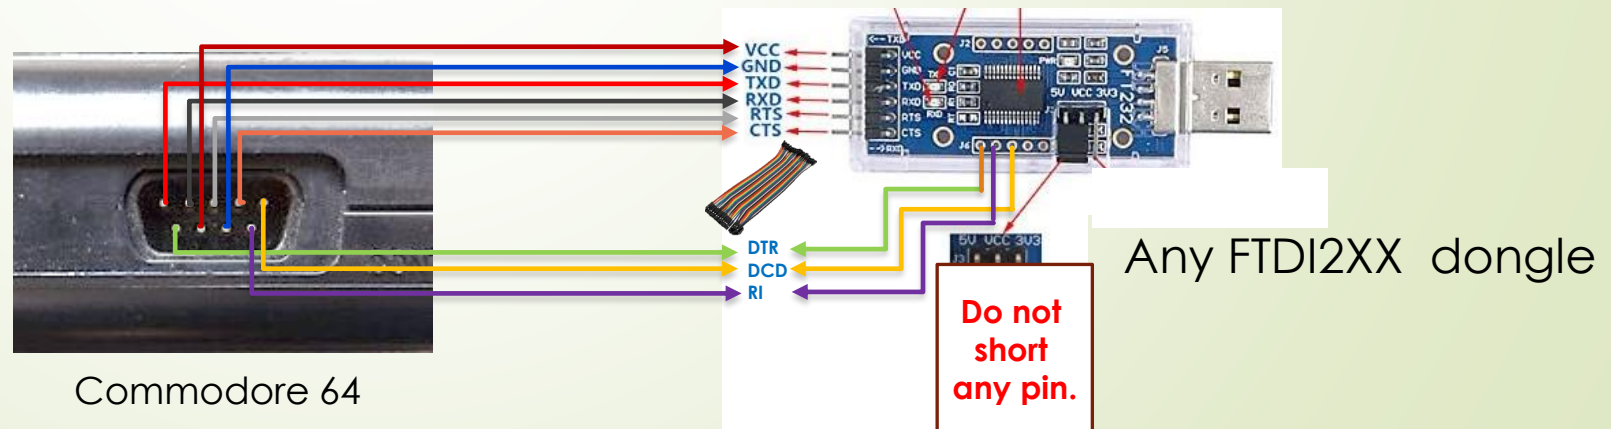

- MAmidiMEMo can drive real MSX machine chips if you use FTDI2xx(232R, 232H and so on). Currently supports NTSC/PAL C64 for SIDs.
I recommend to use ARMSID with ADSR bud fixing.

➤ How to

1. Buy the following parts.

- 1x FTDI2XX dongle (FT232R and so on. Need to support 5V. ***WARN* Please use a genuine dongle.**)
- 1x D-SUB 9 pin female connector and DuPont wires

2. Solder like the following and connect it to the JOYSTICK PORT 2.

VGM Sound Interface(VSIF) Settings

1. Burn VGMPlay_md.bin(for Genesis), VGMPlay_sms.sms(for SMS), VGMPlay_nes*. * (for Famicom^{*1}), VGM_msx*(for MSX^{*2}), P6*.rom(for PC-6001), VGMPlay_c64.prg(for V64) to your FLASH Cart/ROM/Tape and so on.

^{*1} VGMPlay_nes_vrc6/fds/mmc5 ROM does not show any screen but same UI with VGMPlay_nes.nes UI

^{*2} VGM_msx_vkey.rom can skip booting from this ROM while the [V] key is **NOT** pressed at boot time.

2. Set the COMPort/FTDI ID and select "VSIF ***" you wish.

Chip(Dedicated)	
COMPort	COM4
SoundEngine	Real(VSIF Genesis)
CurrentSoundEngine	Real(VSIF Genesis)
Filter	

3. Reset your console and push [Panic!] button
4. (Famicom only)Re-send DPCM data.
5. Done!
6. If you can not sound sounds, make sure soldering and COMPort name.
Or, please contact me.

^{*Some UART dongles may not work properly.}

^{*Compatible consoles may not work properly.}

CTS#	—	D3
DTR#	—	D4
DSR#	—	D5
DCD#	—	D6
RI#	—	D7

Use CMI8738(OPL3) PCI Board

Please use at your own risk

1. Attach the CMI8738 Board to your PC. **Only for 64bit Windows**
2. **Disable Driver Signature enforcement**
3. (**Uninstall and remove** old CMI8738 OPL3 driver if installed.)
4. Install the CMI8738 OPL3 driver located in “.%CMI8738OPL3” folder.
5. Set [SoundEngine] prop to the “Real(CMI8738)”.
6. Have fun!!

Technical information

If you want to use the OPL3 of the CMI8738 directly from your app...

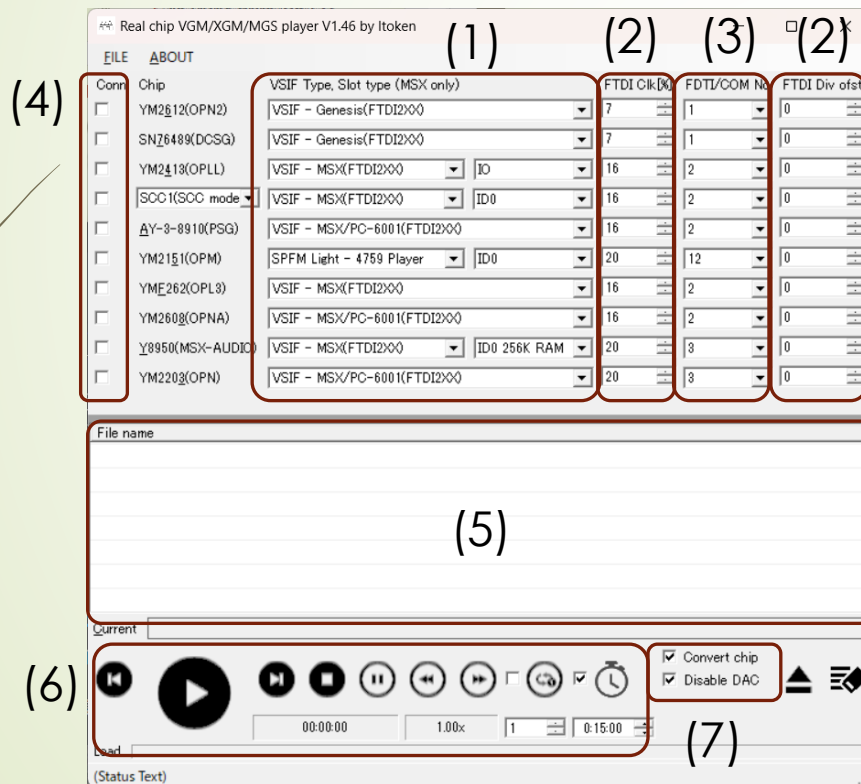

1. Use the helper DLL “CMI8738OPL3Library.dll”.
2. Or, direct access I/O port with admin rights.
eg) DF00H+50H is the OPL3(CMI8738) port.

VGMPlayer

VGMPlayer

VGMPlayer can play a vgm/xgm/mgs file on a real chip via VSIF or SPFM. Substitutes for similar chips are also available. For example, an OPL track can be played on an OPL3 chip.

1) Select interface type

NOTE: Bandwidth of UART is narrow. So you can not play heavy track data properly.

2) Adjust FTDI Clk for FTDIxxx mode for your environment

NOTE: Usually the default value is fine, but if the sound is strange, increase the value. If the performance is slow, decrease the value. If you can not adjust by FTDI Clk, please adjust FTDI Div ofst value.

3) Specify COMPort# for UART/SPFM:
Specify FTDI ID# for FTDI2xxx

4) Check to connect

5) Drop vgm/XGM/MGS files to here

6) Push to play.

7) If the pitch/tempo is wrong, click here.

Known issues and limitations

Known issues and limitations

1. MT-32 & CM32-P can not store/restore last settings.
2. HuC6820 suddenly stop sounding. Please restart MAmi.
3. MAmidiMEMo process stuck after sound interface changed if you used SCCI interface.
4. You need to save the data manually on the DAW (Cubase and so on). Or, keep **open the dummy editor window** of the MAmidiMemo.

Appendix

Trouble Shooting for MAmi

- If you noticed “sound lag” or “stutter”, open the Settings dialog from [TOOL] menu. Check [Sound Type] and [Audio Latency] value.

- 1 packet : 6 bytes(1 byte value) or 9 bytes (2 bytes value) mode

- 1 byte : 3bit(data) + 2bit(Start(Active low) + Clk(Active low) bit)

- 9 bytes mode flag:

7~9th byte data ...

NOTE: In 9bytes mode, send value for Address+1 data first, second is Address+0 data

Integrate with MAmidiMEmo via RPC

- MAmidiMEmo will start RPC server on port 30000 at startup with “-chip_server” option.

So, your application can be integrate with the MAmidiMEmo via RPC.
MAmidiMEmo provides the following API

```
//Write the value to the address to the specific chip
void DirectAccessToChip(unsigned char DeviceID, unsigned char UnitNo, unsigned int address, unsigned int data)
```

- * You can confirm the DeviceID and UnitNumber from the property.
- * Currently, OPLL(ID9), SCC(ID7), AY8910(ID11), YM2608(ID23) chips are supported.
- * If you want to use SCC1(aka SCC+), you need to add 0x100 to the address.

GlobalANK	Global
▼ MIDI	
DeviceID	7
UnitNumber	0
Pitches	Pitches

- Ex)

```
rpc::client* m_rpcClient = new rpc::client("localhost", 30000); //Open RPC port
try {
    //Check connection
    m_rpcClient->call("DirectAccessToChip", (unsigned char)0, (unsigned char)0, (unsigned int)0, (unsigned int)0);
} catch(...) { //Failed }
===
//Write SCC1 wave form
m_rpcClient->async_call("DirectAccessToChip", (unsigned char)7, (unsigned char)0, (unsigned int)0x100, (unsigned int)10);
//All sound off for AY8910
m_rpcClient->async_call("DirectAccessToChip", (unsigned char)11, (unsigned char)0, (unsigned int)7, (unsigned int)0x3f);
//Key off 1ch for OPLL
m_rpcClient->async_call("DirectAccessToChip", (unsigned char)9, (unsigned char)0, (unsigned int)0x20, (unsigned int)0x0);
===
m_rpcClient->~client(); //Close RPC port(But, may not working properly. Recommend commenting out this line.)
```
